ART UNIT PAPER NUMBER

2617

DATE MAILED: 07/05/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

09/981,784

Applicant(s)

LANGE ET AL.

Examiner

Sam Bhattacharya

Art Unit

2617

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 13 April 2006.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-16 and 19-24 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-16 and 19-24 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

2. Claims 1, 3, 6-13 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sriram (US 6,366,606) in view of Ozluturk et al. (US 6,366,607).

Regarding claims 1, 9 and 10, Sriram teaches a base station a radio operated telecommunications system with a receiver (col. 1, lines 31-35) for processing received information, and one or more digital signal processors 10 for performing symbol rate processing and a correlator co-processor 12 that performs at least parts of chip rate processing (col. 4, lines 36-41 and col. 5, lines 19-33 and 51-60).

Sriram fails to disclose that the symbol rate processing and chip rate processing is performed by a single processor. However, in an analogous art, Ozluturk discloses a receiver in which a signal processor 67 performs both symbol rate processing and chip rate processing. See FIG. 2, col. 4, lines 1-21 and col. 6, lines 25-37. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the system of Sriram by performing both symbol rate and chip rate processing in a single processor, as taught by Ozluturk, to eliminate the unnecessary circuit components that previously performed the two kinds of processing, and thereby save space by making the receiver circuitry more compact.

Regarding claims 3, 13 and 21, Sriram fails to specifically teach the signal processor performing chip rate processing before symbol rate processing. However, Ozluturk discloses a system which performs chip rate processing before symbol rate processing. See col. 4, lines 15-

Art Unit: 2617

21. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to perform chip rate processing before symbol rate processing, as taught by Ozluturk, so that the information is despread before it is decoded.

Regarding claim 6, Sriram teaches memory which can be suitable for the intermediate storage of the received information (col. 1, lines 45-50 and col. 2, lines 29 and 49-54).

Regarding claim 7, Sriram teaches despread of the received information by a signal processor (col. 6, lines 34-35).

Regarding claim 8, Sriram teaches decoding of the received information (col. 5, lines 51-60).

Regarding claims 11 and 19, Sriram teaches that the telecommunications system is CDMA (col. 2, lines 18 and 60-67).

Regarding claim 12, Sriram inherently teaches a process for operating a radio-operated telecommunications system, wherein the information received by a base station or a mobile station is subjected to a symbol rate processing by means of a digital signal processor (col. 2, line 34) wherein at least part of the chip rate processing is likewise performed (col. 4, lines 36-41 and col. 5, lines 19-33, 51-60).

3. Claims 2, 14 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sriram in view of Ozluturk et al. and Warty (US 4,827,499).

Regarding claims 2 and 14, Sriram and Ozluturk fail to teach the signal processor performing task allocation for controlling the chip rate processing and the symbol rate

processing. Warty teaches a call control of a distributed processing communications switching system that has processors performing task allocation (col. 5, lines 36-55).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teaching of Warty into that of Sriram and Ozluturk for the obvious reason of being able to pick which function to operate for quicker processing because it decentralizes task functionality.

Regarding claim 16, Sriram fails to teach the distribution of the array or group of signal processors between the chip rate processing and the symbol rate processing is performed by task allocation. The limitations of the claim are rejected as the same reason set forth in claims 2 and 14 above, where it would have been obvious to incorporate the teaching of Warty into Sriram because it decentralizes task functionality.

4. Claims 4, 5, and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sriram, Ozluturk and Warty as applied to claims 2 and 16 above, and further in view of Komara (US 6,161,024).

Regarding claim 4, Sriram fails to teach an array or group of digital signal processors provided. Komara teaches a redundant broadband multi-carrier base station for wireless communications with a group of digital signal processors (Fig. 1 and col. 2, lines 63-66). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teaching of Komara into that of Sriram for the obvious reason of having a plurality of processors to accommodate a plurality of users for faster processing and a backup structure for failure purposes.

Regarding claims 5 and 15, Sriram and Komara fail to teach chip rate processing and symbol rate processing distributed between sub-arrays or sub-groups of signal processors. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to distribute chip rate processing and symbol rate processing between sub-groups as in order have quicker processing and to reduce complexity of the processors functions.

5. Claims 20-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ozluturk et al. in view of Subramanian et al (US 2001/0034227).

Regarding claim 20, Ozluturk discloses a digital signal processor 67 including means for executing symbol rate processing and means for executing chip rate processing, where the digital signal processor is disposed inside a receiver. See FIG. 2, col. 4, lines 1-21 and col. 6, lines 25-37.

Ozluturk fails to disclose means for switching over from the means for executing symbol rate processing to the means for executing chip rate processing, where the digital signal processor is a single digital processor having the symbol rate processing means.

However, in an analogous art, Subramanian discloses coprocessor interface, which is part of a signal processor, that switches between symbol and chip rate processing. See paragraphs 42 and 56. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the system in Ozluturk by incorporating these features taught in Subramanian so that the most effective processing can be performed based on the type of processing required at any given time.

Regarding claims 22-24, Ozluturk fails to disclose signal rate processing including decoding the received information and chip rate processing including despreading the received information based on sources of the received information.

However, Subramanian discloses a configurable spread spectrum device in which signal rate processing including decoding the received information and chip rate processing including despreading the received information based on sources of the received information. See paragraph 42. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the system in Ozluturk and Subramanian by incorporating these further features taught in Subramanian for the purpose of ensuring that the processing is matched to the appropriate sources.

Response to Arguments

6. Applicant's arguments filed on 4/13/06 have been fully considered but they are not persuasive.

Applicant states the following: Ozluturk does not perform even parts of chip rate processing; that chip rate processing is performed not by a digital processor but prior to reaching the digital processor by elements such as channel despreaders.

Examiner respectfully disagrees with Applicant's assertions. Ozluturk clearly states that chip rate processing is performed on col. 4, lines 12-14. There are no channel despreaders in the embodiment shown in FIG. 2 and therefore both symbol rate and chip rate processing is performed by the single signal processor 67. In other embodiments also, such as those shown in

FIGS. 12 and 13, the symbol and chip rate processing is performed by the single processing unit 157. See col. 7, lines 15-29.

Conclusion

7. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Sam Bhattacharya whose telephone number is (571) 272-7917. The examiner can normally be reached on Weekdays, 9-6, with first Fridays off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, George Eng can be reached on (571) 272-7495. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Art Unit: 2617

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
